National Ref :	ÖNORM F 3001		
Title :	Fire incident control systems actuated by fire detection and fire alarm systems - Requirements, tests and marking - Additional requirements to ÖNORM EN 54-2,		
Scope :	This ÖNORM supplements ÖNORM EN 54-2:2010 with performance features of fire incident control systems that are not specified there. All requirements of ÖNORM EN 54-2 must therefore also be met. The following options with the requirements of ÖNORM EN 54-2 are therefore mandatory for a fire control equipment in accordance with this ÖNORM: - 7.10.2: Output type B (option with requirement - also according to 8.2.4 f) and 9.4.1 b)); - 7.10.4: Fault monitoring of fire protection equipment (option with requirement - also according to 8.2.4 f)). If the option "7.10.3 Output type C (option with requirement - also in accordance with 8.2.4 f) and 9.4.1 b))" is not implemented, restrictions must be included in the test report. The purpose of this ÖNORM is to define uniform minimum requirements for a fire control system. It regulates the interaction of all components of a fire control system with a fire alarm system. In general, all individual components must meet the relevant standards and guidelines on their own. Components for which there are no relevant standards and guidelines must meet the requirements of Section 4. Fulfilment of the requirements for individual components does not yet mean that the combination of these components also fulfils the requirements of this ÖNORM. The purpose of fire control is to initiate control processes, such as closing a fire compartment or switching off ventilation systems, depending on the message from a fire alarm system. Control equipment for the control of gas extinguishing systems, control panels for the control of smoke and heat-free systems and electro-acoustic emergency centers for the control of emergency warning systems are not regulated by this ÖNORM.

National Ref : ÖNORM F 3007
Title : Oxygen reduction systems
Scope : Based on the minimum requirements for stationary oxygen reduction systems (ORS) with oxy-gen-reduced air in buildings and industrial plants in accordance with ÖNORM EN 16750, this ÖNORM defines the interaction of all components.
 In general, all individual components must meet the requirements of the relevant standards. Components for which there are no relevant standards must meet the requirements of Section 4.
 Fulfilment of the requirements for individual components does not mean that the combination of these components also fulfils the requirements of this ÖNORM.
 The requirements of this ÖNORM apply for all combinations of individual components of ORS which are suitable for preventing the development of a fire in the area to be protected by lower-ing the oxygen content of the ambient air. Provided that no additional requirements are made, it shall be at least possible to connect peripheral devices not directly serving this purpose without jeopardizing the mandatory functions of the system.
 Control panels for oxygen reduction systems are defined in ÖNORM F 3008.
 In addition to ÖNORM EN 16750, maintenance specifications are also defined in ÖNORM F 3073.

This ÖNORM specifies obligatory functions and selectable functions (options with requirements) that may be provided. Additional functions related to oxygen reduction can be provided. However, they are not dealt with in this ÖNORM. Oxygen reduction systems are regulated in ÖNORM F 3007.  Title : Gaseous extinguishing systems
 Scope : This ÖNORM defines uniform minimum requirements for a gas extinguishing system as well as the interaction of all components.
 In general, all individual components must meet any applicable standards that may exist. Components for which there are no relevant standards must meet the requirements of Section 4.
 Fulfillment of the requirements for individual components does not yet mean that the combination of these components also fulfills the requirements of this ÖNORM.
 The requirements of this ÖNORM apply to all combinations of individual components of gas extinguishing systems that are suitable for extinguishing a fire in the area to be protected by lowering the oxygen content of the ambient air or by introducing chemical gases. Peripheral devices that do not directly serve this purpose must be able to be connected at least without any retroactive effects, unless further requirements are listed below.
 This ÖNORM regulates neither the components of a gas extinguishing system required for the detection of a fire, nor the various necessary controls that are not directly related to warning devices and control of extinguishing systems.

 Title : Electroacoustical alerting systems, consisting of single components - Additional requirements to ÖVE/ÖNORM EN 60849
 Scope : This ÖNORM defines uniform minimum requirements for components of electroacoustical alerting systems as well as their interaction.
 In general, all individual components must meet any applicable standards that may exist. Components for which there are no relevant standards must meet the requirements of Section 4.
 However, compliance with the requirements for individual components does not mean that the combination of these components also fulfills the requirements of this ÖNORM.
 The requirements of this ÖNORM apply to all combinations of individual ENS components that are suitable for informing people in the area to be protected through the targeted use of acoustic messages, directing flows of people and shortening evacuation times. Peripheral devices that do not directly serve this purpose must, unless further requirements are listed below, be connected without any feedback so that the proper function of the system is not impaired in the event of an incident.

Title :	Fire alarm systems - Amendement		
Scope :	This ÖNORM defines the setup and interaction of all components of a fire alarm system to a fire detection system as well as requirements for networked fire detection systems. The purpose of this ÖNORM is to establish uniform minimum requirements for a fire alarm system. All individual components must meet the relevant ÖNORMs in general. Components for which no relevant ÖNORMs are available must meet the requirements of clause 5. A fulfilment of the requirements for individual components does not mean that the combination of these components also meets the requirements of this ÖNORM. The compatibility of individual components has to comply with ÖNORM EN 54-13. The requirements of this ÖNORM apply to all connections of individual components of a fire detection system, which are capable of automatically detecting, evaluating and possibly forwarding fire characteristics. Peripheral devices, which are not directly used for the detection, evaluation and transmission of fire characteristics, must be able to be connected at least back-up-free, as long as no further requirements are present in the following.

National Ref : MKC 1024:2022
Title : Protection of structures against lighting - Average number of thunderstorm days per year
Scope : This standard determines the average annual number of thunderstorm days for the territory of the Republic of Macedonia.
The average annual number of days with thunderstorms is used to determine the level of protection of the building from atmospheric discharges.
The average annual number of days with thunderstorms is shown on the attached isokeraun map prepared by the Republic Hydrometeorological Institute of the Republic of Macedonia. The cartographic view shows that the average annual number of days with thunderstorms in the largest - central part of R. Macedonia is from 30 - 40, and in the extreme western and extreme eastern part it ranges from 40 - 50.
